

# MDM Comparison

In the constantly evolving world of mobile device security, it can be difficult and complicated to become informed of the technology available to Enterprises to enable and secure employee use of mobile devices. Each organization has its own set of functionality and security criteria to look for in a Mobile Device Management platform. The task of evaluating each option against organizational requirements can be time consuming and costly considering the amount of information and options available on the market. No product out there is a “one size fits all” product. Each has its strengths that may work well for one organization but may not work for another. This leaves many enterprises questioning where to look and what to purchase.

PaRaBaL has sought to help solve this problem by identifying and learning the four top MDM products on the market – MobileIron, Airwatch, Maas 360, and Citrix XenMobile. We have evaluated each of these products against a proprietary 23 point matrix comparing functionality and security capabilities. We use this matrix as a starting point to match customer requirements and use cases with the product that will best fit their needs.

Examples of criteria studied in the matrix are below:

## Platform

Scalability (Number of devices supported per sever?)

## Device Management

Consistent Multi-OS Support

## Application Management

Dynamic App Policy Configuration

## Content Management

Native Email Security

## Integration

Internal Certificate Authority Integration

## Reporting/Auditing Capabilities

Exportable Logs

To schedule an introductory call to discuss requirements and see how they match up with each product please call us or send an email.
